

Appendix D

Miscellaneous angler survey data collected from 1928 to 1967 for the Tittabawassee River, its tributaries, and watershed lakes.

Miscellaneous angler survey results are presented in tables D.1 through D.7. These results include angler diary data (Table D.1), complemented surveys using counts and angler interviews (Table D.2), and counts of ice fishing shanties at various locations (tables D.3 through D.7).

Estimated catch rate and mean length of harvested fish are presented in tables D.8, D.10 through D.32 for rivers; and D.33, D.35 through D.50 for lakes. Multiple tables were necessary to accommodate the diverse fisheries found within the watershed. Table D.9 notes creel data by subwatershed, river, and time period, which are found in tables D.10 through D.32. Similarly, Table D.34 notes creel data by subwatershed, lake, and time period, which are found in tables D.35 through D.50.

Data presented in tables D.8 through D.50 are from the General Creel Census and were collected by MDNR conservation officers as they performed their normal duties (Ryckman 1981, Lockwood 2000). Limitations of these data must be clearly understood. While this data collection program was referred to as the General Creel Census, these angler survey data do not represent a true census (i.e., not every member of the population is sampled (Everitt 1998)), rather they are a subsample of the angling population at a given site at a given time. While these data provide historical evidence of species presence, they were not collected following traditional random sampling designs and are correctly referred to as convenience samples (Pollock et al. 1994). Originally, interview records were recorded by angler or angling party. Daily summaries were then prepared for each lake or river site. These daily summaries then contain the catch and effort information for one or multiple anglers. The original interview records have been discarded. As a result, variation between angler and angler party cannot be estimated. Variation (1 Standard Error) reported here is between days. Summaries of these interviews are archived at the Institute for Fisheries Research, Ann Arbor, MI.

Estimated catch rates presented in tables D.8, D.10 through D.32, D.33, and D.35 through D.50 were calculated using the ratio-of-means estimator. Specific formulae for estimating catch rate and catch rate Standard Error (SE) are given in Lockwood et al. (1999). Weighted mean length \bar{L}_s for species s was estimated as:

$$\bar{L}_s = \frac{\sum_{i=1}^N L_{si} C_{si}}{\sum_{i=1}^n C_{si}},$$

for C fish caught on day i and N days sampled. Standard Error SE of \bar{L}_s for species s

was estimated as:

$$SE_s = \sqrt{\frac{\sum_{i=1}^N (L_{si} - \bar{L}_s)^2 C_{si}}{\left(\sum_{i=1}^N C_{si}\right) \left(\left[\sum_{i=1}^N C_{si}\right] - 1\right)}}.$$

Table D.1.—Diary angler creel data collected during spring and summer 1948. Estimates are given with 1 standard error in parentheses.

River	No. Anglers	Hours	Records	Catch per hour	
				Brook Trout	
Tittabawassee	6	30.0	3	0.30 (0.14)	

Table D.2.—Rainbow trout angler survey conducted during winter 1959–60. These estimates are from an April 7, 1960 letter from Max A. Hunt to M. J. DeBoar (Fisheries Division files). Confidence limits are given in parentheses. No definition for confidence limits was given in this letter. Typically, confidence limits (error bounds) are 2 standard errors, which represent 75–95% confidence limits. Rainbow trout catch is assumed to be harvest. Missing confidence limits are given as (–).

Subwatershed	Lake	Hours per trip	Angler		Rainbow trout	
			hours	trips	Harvest	Catch per hour
Main stem-headwaters	George	2.39 (–)	1,437 (230)	601 (106)	391 (109)	0.27 (–)

Table D.11.—Direct contact river angler creel data for the Tittabawassee River main stem-middle Larrabee Lake, Little Molasses, Little Tobacco, Long Lake, Molasses, and Sugar rivers. Estimates are given with 1 standard error in parentheses. One or multiple angler interview records are included per Days (N). When Days (N) equaled 1 or when only 1 length was reported, standard errors could not be estimated and are reported as (–). CPE = Catch per hour; AL = Average length.

Table D.45.—Direct contact lake angler creel data for Hoister, House, Howland, Lily, and Little Long lakes. Estimates are given with 1 standard error in parentheses. One or multiple angler interview records are included per Days (N). When Days (N) equaled 1 or when only 1 length was reported, standard errors could not be estimated and are reported as (–). CPE = Catch per hour; AL = Average length.
